Our idea is to make a website with statistical information, pictures and videos about League of Legends characters, with some basic tutorials. Tables will have stats about the champions and their abilites, and videos and pictures will show abilities and spells.

From the user we will get their Summoner name and rank, and have them create accounts, as well as their preferred roles and champions to play. The analytics we will show will include the current highest win rate champions, as well as the specific champion's stats compared to other champions in the same role.

The data that will be stored in the database will be the user's Summoner name, along with their account information and favourite champions and roles.  This information will be used to filter the website to show information relevant to their preferred characters.
